

Rosetta Basics: IO

VANDERBILT
UNIVERSITY

Goals for this Talk

1. General Rosetta Concepts:

- How do I run basic Rosetta applications?
- Input/Output: file types, options, etc.

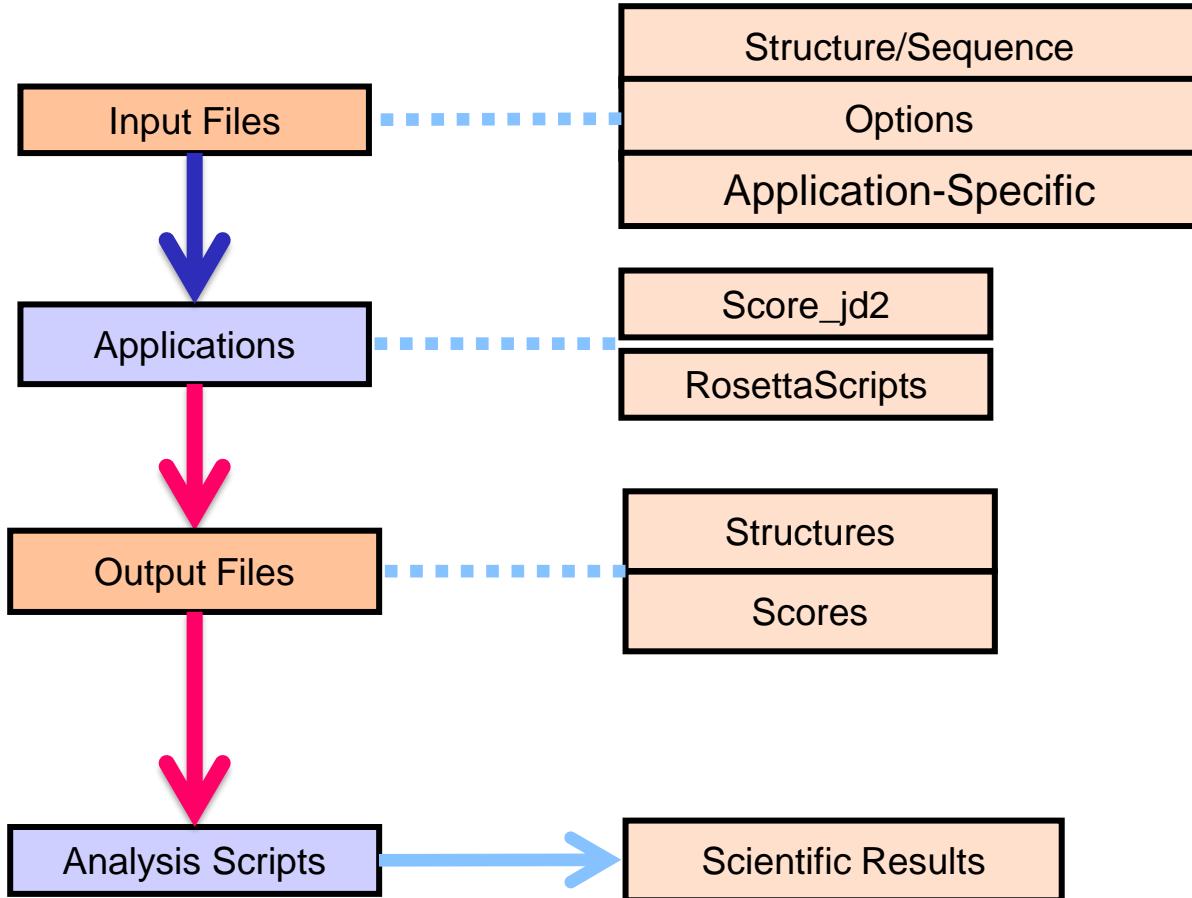

2. Learn where things are in Rosetta

- Your working directory is independent of these Rosetta directories
(AKA your data is stored outside of Rosetta)

QUESTIONS ARE ENCOURAGED!

General Workflow

How do I run a Rosetta command?

Every command has the same basic layout:

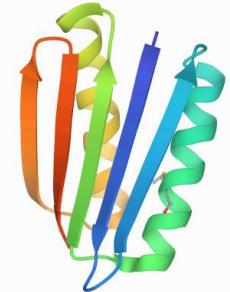

Path to the Rosetta application	Arguments/flags/options
<code><path_to_rosetta>/main/source/bin/<app_name>.default.linuxgccrelease</code>	<code>-arg1 -arg2</code>

Arguments consist of multiple things:

1. Point to input files
2. Point to where you want output files to go
3. Other arguments are protocol-dependent

Your first Rosetta command:

- Scoring 1qys (<https://www.rcsb.org/structure/1QYS>)
- Crystal structure of Top7: A computationally designed protein with a novel fold

```
<path_to_rosetta>/main/source/bin/score_jd2.default.linuxgccrelease -in:file:s 1qys.pdb -out:pdb > 1qys_score.log
```

- Inputs:
 - Running score_jd2 application, which simply scores in the input protein
 - -in:file:s 1qys.pdb : tells Rosetta we're inputting the 1qys.pdb PDB file
 - -out:pdb argument tells Rosetta that we want to save the output PDB file of the scored protein
 - > 1qys_score.log : print terminal output to file called 1qys_score.log
- Outputs:
 - 1qys_0001.pdb : output PDB
 - score.sc : default name for output scorefile
 - 1qys_score.log: tracer of run AKA what is output to the terminal screen when running command

Reading structures into Rosetta

PDB files

- International standard
- Readable by PyMol, MOE, Chimera, etc
- One line per atom
- Useful for small number of structures

Silent files

- Specific to Rosetta
- Compact
- One line per residue
- Useful for archiving many structures
- Binary silent files: more compact, but not human-readable

www.wwpdb.org/documentation/file-format

https://www.rosettacommons.org/docs/latest/rosetta_basics/file_types/silent-file

Common command line arguments

- Common input options:
 - -in:file:s example.pdb ## input a PDB structure file
 - -parser:protocol example.xml ## RosettaScripts XML file
 - -in:file:fasta example.fasta ## input a FASTA sequence file
 - -in:file:silent example.silent ## input a Rosetta silent file
 - -nstruct 42 ## produce 42 outputs
- Common output options:
 - -out:file:silent example_out.silent ## output structures to silent file
 - -out:file:scorefile example_out.sc ## output scorefile for run

Examples of output: the scorefile

score.sc

- One output per line—name of output is in the very last column
 - Each column defines a specific score term for the respective output structure
 - Second column is the “total_score”
 - The following columns are individual scoreterms (described in detail in later talk)
 - Excerpt of example scorefile here, but recommend you look at your own score.sc output file

Examples of output: the output PDB

1qys_0001.pdb

- One atom/line just like normal PDBs
- Scroll to the bottom and there is per residue score information

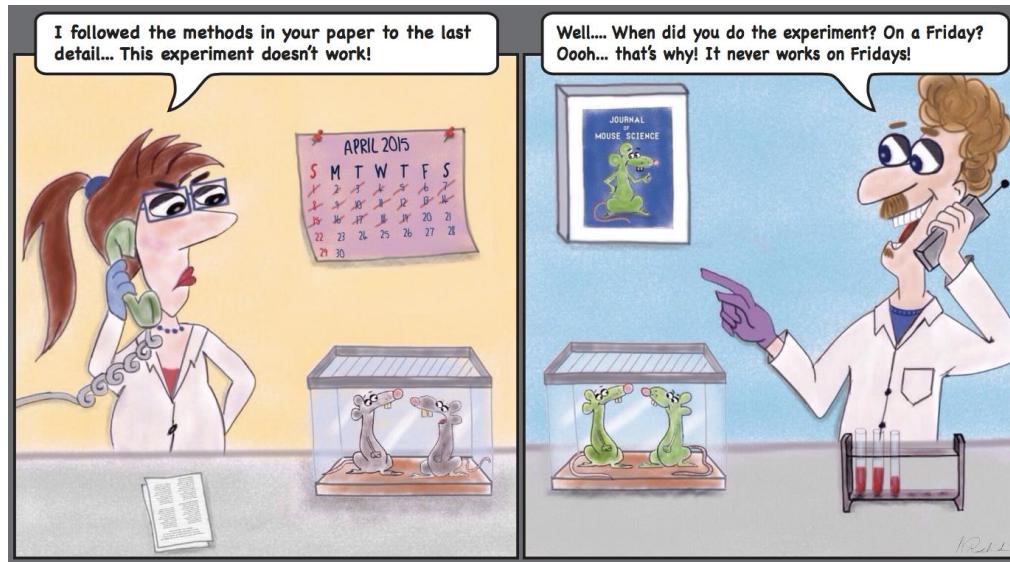

```

Examples of output: Tracer output (log files)

1qys_score.log

- Shows exactly the command line you are running at the beginning
- Which databases are being used, calling protocols, warnings, errors, etc.
- Very useful for debugging to figure out where problems are coming from
- Makes your protocol reproducible!!

Examples of output: Tracer output (log files)

1qys_score.log

```
core.init: Rosetta version exported from http://www.rosettacommons.org

Options to control tracer output *these files can get very long!*

- Silence certain tracers:
 - mute core.chemical.ResidueTypeSet
- Change verbosity level (Error/Warning/Info/Debug/Trace)
 - out:levels all:Warning core.init:Info

Other files: application-specific

- Span File: Defines which residues are in the membrane
- Loops File: Identifies the loop residues for loop closure
- Params File: Custom parameters for small molecules or non-canonical amino acids
- Constraint File: Experimentally derived restraints
- Fragment File: Short protein segments used for comparative modeling and de novo folding
- Res Files: Indicates which residue positions should be designed

Protocols can get complicated...

Toward high-resolution prediction and design of transmembrane helical protein structures

P. Barth, J. Schonbrun*, and D. Baker†

Department of Biochemistry and Howard Hughes Medical Institute, University of Washington, Seattle, WA 98195

```
$ROSETTA/main/source/bin/AbinitioRelax.linuxgccrelease -database  
../../rosetta_database -in:file:fasta ./input_files/1elwA.fasta -  
in:file:native ./input_files/1elw.pdb -in:file:frag3  
./input_files/a1elwA03_05.200_v1_3 -in:file:frag9  
./input_files/a1elwA09_05.200_v1_3 -ab initio:relax -relax:fast -  
ab initio::increase_cycles 10 -ab initio::rg_reweight 0.5 -  
ab initio::rsd_wt_helix 0.5 -ab initio::rsd_wt_loop 0.5 -use_filters  
true -psipred_ss2 ./input_files/1elwA.psipred_ss2 -kill_hairpins -  
out:file:silent 1elwA_silent.out  
-nstruct 10
```

OR

```
$ROSETTA/main/source/bin/AbinitioRelax.linuxgccrelease @options.txt
```

Use an options file for your runs

Why?

- Easier to read/organize
- Reproducibility!

```
$ROSETTA/main/source/bin/AbinitioRelax.linuxgccrelease @options.txt
```

```
-in:file
    -fasta ./input_files/1elwA.fasta
    -native ./input_files/1elw.pdb
    -frag3 ./input_files/aa1elwA03_05.200_v1_3
    -frag9 ./input_files/aa1elwA09_05.200_v1_3
-psipred_ss2 ./input_files/1elwA.psipred_ss2
-ab initio:relax
-relax:fast
-ab initio::increase_cycles 10
-ab initio::rg_reweight 0.5
...
-out:file:silent ./output_files/1elwA_silent.out
-nstruct 10
```
