Rosetta Scoring Function

Prepared by Cristina Elisa Martina

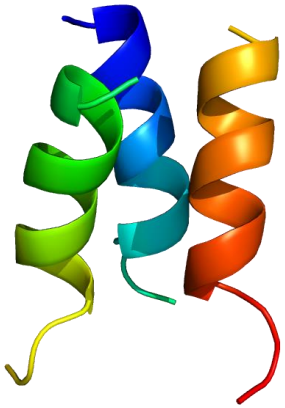
Why we need a scoring function?

Example 1:

Same amino acid sequence, different conformations. Which one is the more stable?

Conformation A

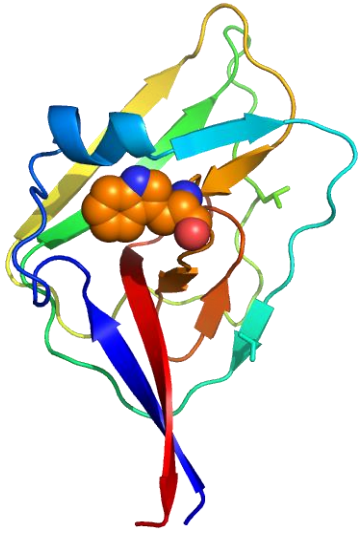
Conformation B



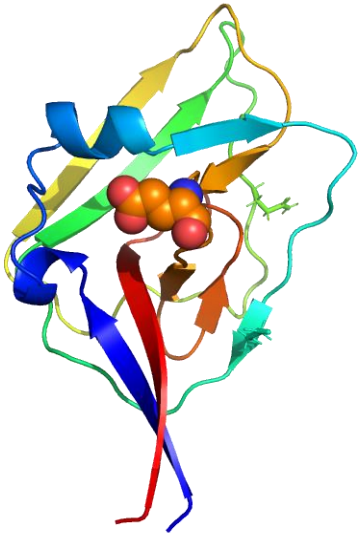
Example 2:

Different single point mutations (or multiple mutations). Which residue is the best one?

Mutation A



Mutation B



A scoring function is able to distinguish and rank different models.

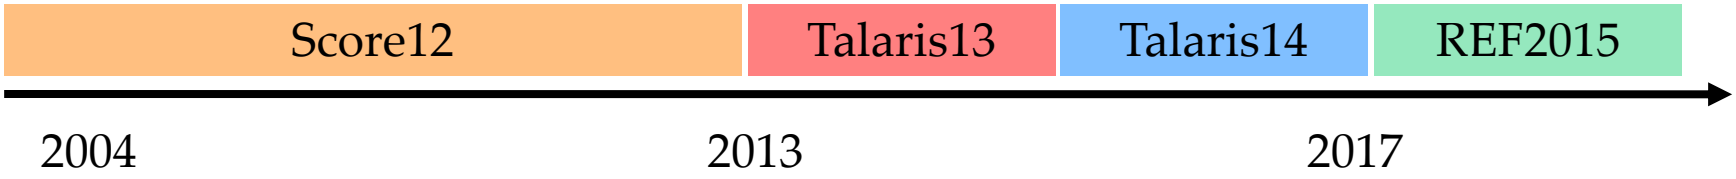
How discriminate among A and B?

Scoring Function
(or Energy Function)

$$\Delta E_{\text{total}} = \sum_i w_i E_i(\Theta_i, \text{aa}_i)$$

The total energy (ΔE_{total}) is the sum of weighted energy terms ($\Sigma_i w_i E_i$) that are calculated as functions of geometric degrees of freedom (Θ_i) and chemical identities (aa_i).

Scoring Functions in Rosetta:



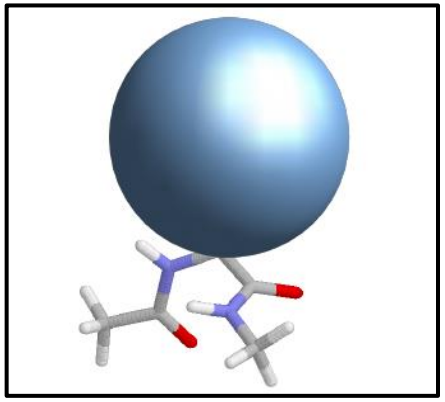
Historically the total energy was given in Rosetta Energy Units, **REU**

The newest scoring function (REF2015) can be converted to **kcal/mol**

Rosetta updates its scoring functions to improve the accuracy of the scoring.

Types of Scoring Functions:

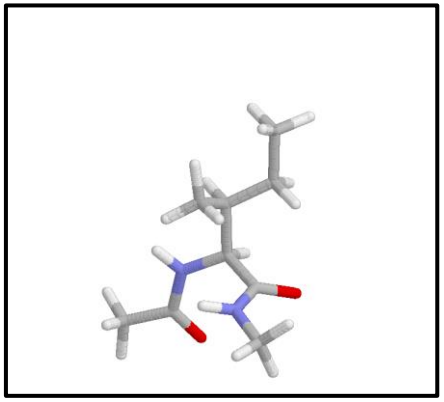
Low Resolution



Centroid-mode or Coarse-Grain
Simple energy function
Faster

Global search of conformational space
(Ab-initio folding, loop modeling)

High Resolution



Full-Atom or All-Atom
More accurate energy function
Time consuming

Local search of conformational space

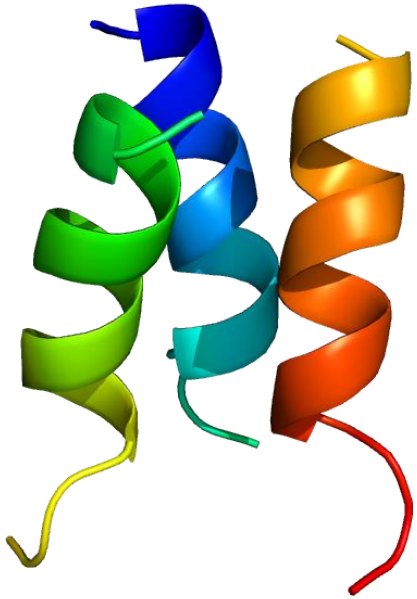
Rosetta has multiple types of scoring function, depending on the needs.

Rosetta Scoring: The lower the better!

Conformation A

Total Energy = 253 REU

Conformation B



Total Energy = -82 REU

Conformation B is the more stable because it has the lower energy (-82 REU).

Rosetta Scoring: The lower the better!

Conformation A

Conformation B

But why the energy is different?

Total Energy = 253 REU

Total Energy = -82 REU

$$E_{elec}(i, j, d_{i,j}) = \frac{C_0 q_i q_j}{\epsilon(d_{i,j})} \begin{cases} \frac{1}{d_{i,j}^{\,2}} - \frac{1}{d_{max}^{\,2}} & d_{i,j} \leq d_{max} \\ 0 & d_{max} < d_{i,j} \end{cases}$$
